

Introduction to the Class Project Scenario

- ▶ Your boss is a stickler for being on time to work and wants you to arrive a few minutes before 8am so that you can get a good start (if you arrive too early then you will have to wait until the door is unlocked). You have been working this job for 7 months and thought your arrival time would stabilize, but no matter what you do, your time varies seemingly each day and you need to do something about it before you get in to trouble (you are already being reprimanded for being late and don't want to be let go). Being late also disrupts your co-workers jobs. It takes about 45 minutes for you to drive to work. You could just get up earlier but you know that the traffic is heavier at that time so that doesn't often help, plus if you are too early you would have to wait for the door to unlock. You have tracked your arrival time over the past month and found that it varies from 13 minutes early to 8 minutes late. You have no idea why and have to correct it.

This scenario will be built on as we go through training;
